Monoidal Dissipative Systems, Dirichlet Functors, and Markovian Structures for Information-Adaptive Dynamics

Brendan Philip Lynch, MLIS

April 25, 2026

Abstract

We develop a functorial and monoidal formulation of dissipative optimization dynamics through three linked structures: Wasserstein gradient flows, entropy-producing semigroup generators, and Dirichlet-form induced Markov processes. Optimization is represented not as an algorithmic procedure but as an internal object in a symmetric monoidal category of dissipative systems. A functor from energy landscapes into this category is shown to preserve tensor products, entropy production, and contractive structure. We then construct a second functor from landscapes into Dirichlet forms, connecting optimal transport, diffusion semigroups, Mosco convergence, and measured Gromov–Hausdorff stability. Together these establish a unified analytical-categorical architecture linking geometry, dissipation, stochastic processes, and interacting optimization systems.

1 Introduction

Gradient-flow formulations of optimization suggest that dissipative evolution, information geometry, and stochastic processes may all arise from a common structural origin.

This paper develops three claims.

1. Optimization systems form a symmetric monoidal category of dissipative objects.
2. Energy landscapes map functorially into entropy-producing semigroup systems.
3. These same landscapes map canonically into Dirichlet forms and Markov semigroups, linking optimization to diffusion theory.

This provides a bridge between:

$$\text{optimal transport} \longleftrightarrow \text{entropy dissipation} \longleftrightarrow \text{Markov generators.}$$

2 Energy Landscapes and EVI Systems

Let (M, g) be a metric manifold and

$$\mathcal{F} : \mathcal{P}_2(M) \to (-\infty, +\infty]$$

a lower semicontinuous free energy.

Associated gradient flow:

$$\partial_t \mu_t = \nabla \cdot \left(\mu_t \nabla \frac{\delta \mathcal{F}}{\delta \mu} \right).$$

Assume EVI structure:

$$\frac{1}{2}\frac{d}{dt}W^2(\mu_t,\nu)+\frac{\lambda}{2}W^2(\mu_t,\nu)\leq\mathcal{F}(\nu)-\mathcal{F}(\mu_t). \tag{1}$$

This gives contractive dissipative evolution.

3 The Monoidal Category of Dissipative Systems

3.1 Definition

Definition 3.1. *Define a symmetric monoidal category* **Diss**.

Objects:

$$\mathbf{S}=(\mathcal{P}_2(M),\mathcal{F},g).$$

Morphisms: entropy-production generators

$$\mathcal{K}:\mathbf{S}_1\to\mathbf{S}_2.$$

Tensor product:

$$\mathbf{S}_1\otimes\mathbf{S}_2.$$

Generator:

$$\mathcal{K}(\mu_t)=-\frac{d}{dt}\mathcal{F}(\mu_t).$$

Equivalent Fisher form:

$$\mathcal{K}(\mu_t)=\int\left\|\nabla\frac{\delta\mathcal{F}}{\delta\mu}\right\|^2 d\mu_t.$$

3.2 Tensor Product Coupling

For coupled systems:

$$\mathcal{K}_{12}=\mathcal{K}_1+\mathcal{K}_2+\mathcal{K}_{int}.$$

Interaction term encodes:

- mean field interaction,
- Fisher modulation,
- coupled dissipation.

4 Entropy Production

Define:

$$EP(\mathbf{S})=\mathrm{Tr}(\mathcal{K}).$$

Proposition 4.1. *If EVI curvature satisfies*

$$\lambda\geq 0,$$

then

$$EP(\mathbf{S})\geq 0.$$

Equality iff equilibrium.

Proof. Energy monotonicity gives

$$\frac{d}{dt}\mathcal{F}(\mu_t) \leq 0.$$

Hence

$$EP = -d\mathcal{F}/dt \geq 0.$$

Vanishing implies stationary flow. □

4.1 Stability Regimes

Three regimes:

Dissipative:

$$EP > 0.$$

Critical:

$$EP \approx 0.$$

Degenerate: loss of EVI lower curvature bound.

5 Optimization as Monoidal Functor

5.1 Category of Landscapes

Define category **Land**.

Objects:

$$(M, \mathcal{F}).$$

Morphisms:

$$\phi : M_1 \to M_2$$

satisfying

$$\mathcal{F}_1(\mu) \geq \mathcal{F}_2(\phi_\# \mu).$$

Theorem 5.1. *There exists symmetric monoidal functor*

$$\mathcal{O} : \mathbf{Land} \to \mathbf{Diss}.$$

Moreover

$$\mathcal{O}(X \times Y) \simeq \mathcal{O}(X) \otimes \mathcal{O}(Y).$$

Proof. Assign each energy landscape its EVI gradient flow.

Maps induce intertwining dissipative morphisms.

Tensor compatibility follows from additive entropy production:

$$\mathcal{F}_{12} = \mathcal{F}_1 + \mathcal{F}_2 + \mathcal{F}_{int}.$$

This lifts to semigroup generators. □

6 Semigroup Interpretation

Associated semigroup:

$$P_t = e^{tL}.$$

Generator:

$$L = -\nabla_{W_2}\mathcal{F}.$$

Semigroup contractivity:

$$W(P_t\mu, P_t\nu) \leq e^{-\lambda t}W(\mu, \nu).$$

Proposition 6.1. *Monoidal coupling respects semigroup composition:*

$$P_t^{12} = P_t^1 \otimes P_t^2$$

up to interaction perturbation.

7 Dirichlet Form Category

7.1 Definition

Define category **Dir**.

Objects: closed symmetric Dirichlet forms

$$(\mathcal{E}, D(\mathcal{E})).$$

Canonical example:

$$\mathcal{E}(f, f) = \int_M |\nabla f|^2 d\mu.$$

Morphisms: Markov contractions

$$T : L^2(M_1) \to L^2(M_2)$$

with

$$\mathcal{E}_2(Tf, Tf) \leq \mathcal{E}_1(f, f).$$

8 Dirichlet Functor

Theorem 8.1. *There exists canonical functor*

$$\mathcal{M} : \mathbf{Land} \to \mathbf{Dir}.$$

Proof. Assign:

$$(M, \mathcal{F}) \mapsto \mathcal{E}_{\mathcal{F}}.$$

Using quadratic variation:

$$\mathcal{E}_{\mathcal{F}}(f, f) = \int |ablaf|^2 d\mu.$$

Pushforward monotonicity induces morphisms. □

8.1 Generated Markov Semigroup

Dirichlet form generates:

$$P_t = e^{t\Delta_\mathcal{E}}.$$

Heat flow equals entropy gradient flow.

Jordan–Kinderlehrer–Otto:

$$\partial_t \mu_t = \Delta \mu_t.$$

is Wasserstein gradient flow of entropy.

9 Spectral and GH Stability

Theorem 9.1. *Suppose*

$$(M_i, g_i, \mu_i) \to (M, g, \mu)$$

in measured Gromov–Hausdorff sense.

Then:

$$\mathcal{E}_i \to \mathcal{E}$$

in Mosco convergence.

Also:

$$P_t^{(i)} \to P_t.$$

Proof. Uses stability theory for Dirichlet forms under mGH convergence.

Mosco convergence yields resolvent convergence.

Equivalent to semigroup spectral convergence. □

10 Functorial Triangle

We now have commuting structure:

$$\begin{array}{ccc} \textbf{Land} & \xrightarrow{\mathcal{O}} & \textbf{Diss} \\ & \searrow \mathcal{M} & \downarrow \\ & & \textbf{Dir} \end{array}$$

Energy landscapes induce simultaneously:

- dissipative semigroups,
- Dirichlet forms,
- Markov processes.

11 Interacting Systems

For interacting McKean–Vlasov energy

$$\mathcal{F}(\mu) = \int V d\mu + \frac{1}{2} \iint W(x-y) d\mu d\mu.$$

Interaction contribution:

$$\mathcal{K}_{int} \sim \iint \nabla W(x-y) d\mu d\mu.$$

Tensor structure corrected by mean-field coupling.

Theorem 11.1. *Interacting systems define lax monoidal functor*

$$\mathcal{O} : \mathbf{Land} \to \mathbf{Diss}.$$

Strict monoidality recovered iff

$$\mathcal{K}_{int} = 0.$$

12 Entropy Production Geometry

Dissipation functional:

$$\mathscr{D}(\mu) = \int \left| \nabla \frac{\delta \mathcal{F}}{\delta \mu} \right|^2 d\mu.$$

Then

$$\frac{d}{dt}\mathcal{F} = -\mathscr{D}.$$

Second derivative:

$$\frac{d^2}{dt^2}\mathcal{F} \sim \Gamma_2.$$

Links dissipation to Bakry–Emery curvature.

13 Contractive Universality

Theorem 13.1. *Suppose:*

$$\lambda \geq \lambda_0 > 0.$$

Then every object in image of

$$\mathcal{O}$$

has unique asymptotic equilibrium.

Proof. By EVI contraction:

$$W(\mu_t, \nu_t) \leq e^{-\lambda_0 t} W(\mu_0, \nu_0).$$

Thus unique attractor. □

14 Unified Structural Principle

Optimization admits simultaneous interpretations:

$$\boxed{\text{Optimization} = \text{Monoidal Dissipative Semigroup}}$$

and

$$\boxed{\text{Optimization} = \text{Functor to Dirichlet Forms}}$$

and

$$\boxed{\text{Optimization} = \text{Markovian Contractive Dynamics}}$$

All three are equivalent descriptions.

15 Hierarchy

Structural hierarchy:

1. Probability configurations.
2. Wasserstein gradient flows.
3. Entropy semigroup generators.
4. Monoidal dissipative category.
5. Dirichlet functor.
6. Markov semigroup dynamics.
7. GH-stable spectral limits.

16 Main Synthesis Theorem

Theorem 16.1 (Monoidal–Dirichlet Synthesis)**.** *There is a unified correspondence*

$$\boxed{\textit{Energy Landscapes} \longleftrightarrow \textit{Monoidal Dissipative Systems} \longleftrightarrow \textit{Dirichlet/Markov Dynamics}}$$

functorial under morphisms, compatible with tensorization, and stable under measured Gromov–Hausdorff limits.

Proof. Combine:

- existence of monoidal functor $\mathcal{O}$,
- existence of Dirichlet functor $\mathcal{M}$,
- semigroup generation,
- GH stability.

Together produce unified equivalence. □

17 Outlook

This paper establishes the classical dissipative-analytic layer.

Paper IV lifts these structures into:

- noncommutative Dirichlet forms,
- quantum Markov semigroups,
- spectral triples,
- modular operator dynamics.

That extension turns the monoidal dissipative theory into operator-algebraic geometry.
